## This differentiated 007 could hold a license to be best-in-class; initiating with a BUY, \$35 PT

### BUY into Phase 2 data in 3Q26 for ML-007C-MA in schizophrenia

We are initiating coverage of MapLight Therapeutics (MPLT) with a BUY rating and \$35 price target. MPLT is a San Francisco/Boston-based company that is developing novel therapeutics for central nervous system (CNS) disorders. Lead candidate, ML-007C-MA is a novel combination of a centrally acting M1/M4 muscarinic agonist with a peripheral antagonist to block ex-CNS activity/side effects. This elegant mechanism of action has been somewhat de-risked by Bristol/Karuna's Cobenfy (xanomeline/trospium), which in Sep-24, became the first FDA approval in decades for a product with a novel mechanism for schizophrenia. MPLT is attempting to take this concept several steps further with a differentiated product that could have best-in-class features on efficacy/safety and a more convenient dosing profile, which we believe could help spur solid real-world use, if approved. ML-007C-MA is currently in Phase 2 trials, i.e., ZEPHYR for schizophrenia with a readout in 3Q26, and VISTA for Alzheimer's disease psychosis (ADP) with a readout in 2H27. Against this backdrop, we like the stock based on three key reasons: 1) de-risked mechanism presents opportunity into ZEPHYR data in 3Q26, and we view MPLT as undervalued on the schizophrenia opportunity alone; 2) ADP is an even-bigger opportunity with no specific products approved; and 3) other pipeline candidates exist, and ML-004 is in the IRIS Phase 2 trial for autism spectrum disorder (ASD) with data in 3Q26, on which we see limited downside with potential for a positive surprise. Over the longer term, we note that companies with successful neuro-focused development programs present significant scarcity value to strategics and investors.

### We view MPLT as undervalued on the schizophrenia opportunity alone

With 3mn US patients per MPLT, we view schizophrenia as a robust opportunity for a differentiated product. Standard-of-care (atypical antipsychotics) can be efficacious, but undesirable side effects (weight gain, movement disorders, etc.) exist. Cobenfy is a good option, but our expert checks suggest dosing (2x/day) and side effects (nausea/vomiting, gastrointestinal) could be real-world issues. So, if ML-007C-MA's differentiated profile, based on better synchronized agonist/antagonist exposure, translates well, we see a clear place for it. At its ~\$800mn market cap (<1x our peak sales or ~2x our probability-adjusted sales), one could make the argument that MPLT is undervalued on schizophrenia alone. On a positive ZEPHYR trial, which also has ADP readthroughs, we see a significant move of 50-100%, if not higher, especially if 1x/day works well. An overtly negative outcome would surprise us, and note MPLT has ~\$9 in cash/share.

### ADP presents even more unmet need, larger opportunity vs. schizophrenia

MPLT estimates 40% of the ~7mn US AD patients suffer from psychosis. With no specific product approved, ADP presents a higher unmet need vs. schizophrenia. Here, we will be watching Bristol's ADEPT readouts for Cobenfy in ADP that could come in late-26 very closely. We will also be keeping an eye on Acadia's Phase 2 readout for ACP-204 (remlifanserine) for ADP in the August-October 2026 timeframe.

### PT of \$35 is conservative, represents potential upside of ~100%

We value MPLT using a discounted cash flow (DCF) methodology. For our DCF, we include ML-007C-MA for schizophrenia/ADP with probabilities of approval of 40%/30%, which could be conservative given a somewhat de-risked mechanism. We model sales from 2026E-36E with launches in 2030E/2031E for schizophrenia/ADP, at a \$16k net price at launch. Our peak patient share/sales in 2036E (model horizon) are 3.5%/ \$1.1bn for schizophrenia and 3.75%/2.6bn for ADP. We give no specific credit for other programs or ex-US revenues. We also probability-weight R&D/SG&A expenses in 2027E + (post-initial Phase 2 data) and compute a terminal value based on a 0% terminal growth rate. We discount after-tax profits back to the end of 2026E at a rate of 15%. This leads to our PT of \$35.

## Executive summary

### We are BUYERS into 3Q26 ZEPHYR Phase 2 data for ML-007C-MA in schizophrenia

MapLight (MPLT) is a San Francisco, CA/Boston, MA-based clinical-stage biotechnology company that is developing products for central nervous system (CNS) disorders. Lead candidate, ML-007C-MA, is currently in Phase 2 trials, ZEPHYR for schizophrenia and VISTA for Alzheimer's disease psychosis (ADP). MPLT expects top-line Phase 2 data from ZEPHYR for schizophrenia in 3Q26 and VISTA for ADP in 2H27. Separately, another candidate, ML-004 is in the IRIS Phase 2 trial for autism spectrum disorder (ASD), for which MPLT expects data in 3Q26. See Table 1 for key catalysts.

Given the product's mechanism is somewhat derisked by the Cobenfy trial and regulatory experience for schizophrenia, we view the upcoming ZEPHYR Phase 2 trial readout in 3Q26 as having the potential to drive significant upside, especially as it has potential readthroughs for the ADP VISTA Phase 2 data coming in 2H27.

**Table 1: Key upcoming catalysts for MPLT**

| Event                              | Timing | Indication                     | Comments                                       |
|------------------------------------|--------|--------------------------------|------------------------------------------------|
| Phase 2 ZEPHYR data for ML-007C-MA | 3Q26   | Schizophrenia                  | 300 patients, 25 US sites                      |
| Phase 2 IRIS data for ML-004       | 3Q26   | Autism spectrum disorder (ASD) | 160 adult/adolescent patients; 29 global sites |
| Phase 2 VISTA data for ML-007C-MA  | 2H27   | Alzheimer's disease psychosis  | 300 patients, 100 global sites                 |

Source: Company reports, ClinicalTrials.gov, Canaccord Genuity estimates

### Our doctor checks suggest product could have a clear place in treatment paradigm

ML-007C-MA's differentiation could come down to potentially more convenient dosing if the 1x/day regimen works well in trials. Its side effect profile could also be better due to a potentially better synchronization of agonist/antagonist exposure. In our expert checks, these two variables, in this order, appeared to be most important from a real-world perspective. In short, if MPLT's product makes it through clinical trials and has a solid differentiated profile that targets these factors, we view the product as having the ability to slot into the treatment paradigm for schizophrenia. We also believe that at MPLT's current market cap of ~\$800mn, which translates to less than 1x our unadjusted peak sales for schizophrenia, the stock is undervalued on this opportunity alone. We are also not accounting for any potential benefits in other domains of schizophrenia, i.e., treatments exist for positive symptoms, but not for negative symptoms or cognitive impairment associated with schizophrenia (CIAS).

### Near term, it's schizophrenia, while longer term, ADP holds the key

Clearly, with no product specifically approved and with ~3mn patients suffering from ADP, that indication has the potential to be a significant longer-term driver. In this context, with psychosis as a key feature, we would be surprised if the product were to work in schizophrenia, but not ADP. In this indication, we remain very mindful of safety in older patients, which could hold the key to eventual success.

### Standard caveats around neuro trials, development-stage biopharma apply

The underlying mechanism of action of ML-007C-MA appears sufficiently de-risked as competitor, Bristol Myers Squibb's Cobenfy (xanomeline/trospium) is already approved for schizophrenia. That product is also in several Phase 3 trials for ADP, some of which could have data readouts by the end of 2026. We note, however, that the standard caveat around neuropsychiatry-focused studies apply in that the outcome of such trials can be unpredictable due to reasons such as high placebo rates, for example. ML-007C-MA at its 330/6mg QD and 210/3mg BID dose has been safe thus far, but its risk-benefit profile is yet to be fully established later-stage clinical

trials that could lead to approval. The company is funded through 2027, which includes several data readouts. But, as with any biopharma company at this stage of its evolution, the potential for dilution exists.

#### **Our \$35PT is based on conservative assumptions**

Based on ML-007C-MA's somewhat derisked mechanism, we view our probabilities of approval for schizophrenia/ADP of 40%/30% as conservative. We also believe our peak sales assumptions of \$1.1bn and \$2.6bn in 2036E veer toward the conservative if the product's efficacy and side-effect profile match what MPLT has set out to do in terms of differentiation.

## Investment positives

#### **Somewhat derisked mechanism makes stock very interesting ahead of 3Q26 data**

ML-007C-MA is a novel combination of a centrally acting M1/M4 muscarinic agonist with a peripheral antagonist to block ex-CNS activity/side effects. This elegant mechanism of action involving muscarinic receptor antagonism, has been somewhat de-risked by Bristol/Karuna's Cobenfy (xanomeline/trospium), which in Sep-24, became the first FDA approval in decades for a product with a novel mechanism for schizophrenia. So, we see opportunity ahead of the 3Q26 ZEPHYR Phase 2 trial readout for schizophrenia. At its current market cap of ~\$800mn, which is less than 1x our peak sales (or 2x our probability adjusted peak sales), one could make the argument that MPLT is undervalued on the schizophrenia opportunity alone. In any case, we believe there is significant room to run given psychosis is a feature of both schizophrenia and ADP, which presents an even larger market opportunity.

#### **Nice cadence of catalysts to keep investors interested**

MPLT has two Phase 2 trial readouts in 3Q26 for ML-007C-MA in schizophrenia and for ML0004 for autism spectrum disorder. In addition, MPLT expects to report Phase 2 data for ML-007C-MA in ADP in 2H27. We view this as a nice cadence of catalysts that can keep data-driven investors interested in the stock. Arguably, and perhaps rightly so, investor focus is currently on the schizophrenia and ADP datasets, and we view ASD as not in the stock in any meaningful way at current levels. As such, we also view downside on a negative ASD dataset as somewhat limited, with potential for an upside surprise if the trial were to hit. Separately, we are also keeping an eye on some external catalysts, i.e., readouts from Bristol's ADEPT Phase 3 trials for Cobenfy in ADP coming later in 2026, and ACAD's Phase 2 readout for remlifanserin (a serotonin 5-HT2A inverse agonist) in ADP between August to October 2026.

#### **Differentiated, potential best-in-class product could see significant real-world use**

For a long time now (see our earlier primer on muscarinic receptor approaches [here](#), for example), we have viewed Karuna/Bristol's xanomeline/trospium combo, now approved for schizophrenia as Cobenfy, as a conceptually and scientifically elegant way in which to tease out a product's solid neuro potential. We view MPLT's attempt with ML-007C-MA as taking this concept several steps further by developing a combination that checks several boxes that could help the product to see significant use if it is also developed successfully. Specifically, the M1/M4 agonist has potential best-in-class characteristics (see pages 14-15) that could lead to better efficacy, and synergism between the agonism/antagonism that could lead to a better side-effect profile. In addition, features of MPLT's combo could translate to a better dosing profile with more convenient dosing titration and lack of fasting requirements. Below, we address some of these characteristics.

***ML-007C-MA synergism could be advantageous for patient adoption***

MPLT intends to improve upon the safety and tolerability profile of Cobenfy by synchronizing exposure levels of ML-007 with fesoterodine to minimize side effects resulting from peripheral muscarinic agonism/antagonism mismatching. This approach could translate to more convenient dosing (QD or BID), no fasting requirements, and minimal titration. By way of comparison, Cobenfy is currently dosed BID in schizophrenia and TID in ADP, needs to be taken one hour before or two hours after a meal, and is titrated for three to eight days in schizophrenia and for five weeks in ADP. This strategy offers differentiation from Cobenfy and may bode well for real-world adoption.

***So far, ML-007C-MA is safe and well tolerated at its intended doses***

ML-007C-MA is in Phase 2 at 210/3mg BID and 330/6mg QD for schizophrenia, and at 210/3mg BID for ADP. At its intended doses, ML-007C-MA has been safe and well tolerated so far. In the most recent of the four Phase 1 trials run by MPLT, which utilized the targeted drug formulation, there were no anticholinergic treatment-emergent adverse events (TEAE) and the majority of TEAEs were of mild and transient nature. In elderly adults, there were four anticholinergic TEAEs that were mostly mild and transient. While safety signals in elderly were detected at the 330/6mg QD dose, there is potential to explore lower QD doses in future trials that could offer optionality to patients.

***Targeting large indications where a desirable product profile really matters***

The schizophrenia market in the US (~3mn patients per MPLT) is large. The standard of care currently involves atypical antipsychotics, several of which have less-than-desirable side-effect profiles. On the other hand, real-world usage of Cobenfy suggests its product profile could need some improvement as well. So, in schizophrenia, efficacious treatment options exist, but other limitations mean there is clearly a place for an efficacious product that also has a desirable side-effect profile. As such, MPLT's product could fit in this space nicely.

On the ADP side, the market and unmet need are relatively larger. Specifically, MPLT believes around 40% of the 7mn of AD patients in the US experience psychosis. There are no specifically approved treatments currently for ADP. Off-label use of atypical antipsychotics exists but needs care given the side effect profiles of those products especially in older patients. In the near term, we await several readouts from Bristol's ADEPT Phase 3 program later this year, which could have read-throughs for MPLT's ADP program. We also await ACAD's Phase 2 readout for remlifanserin (a next-generation serotonin 5-HT<sub>2A</sub> inverse agonist) between August to October of 2026.

***Potential for new chemical entity (NCE) exclusivity, robust patent life***

If approved for schizophrenia, we expect the FDA to grant new chemical entity exclusivity (NCE) for ML-007C-MA as the M1/M4 agonist part has not been previously approved for pharmaceutical use in the US. This means the product could effectively have 7.5 years of exclusivity, i.e., 5 years of NCE and an automatic 30-month stay of approval on generic filers if MPLT commences patent litigation within 45 days of notification of a generic filing (this applies except in the unlikely event that a court case involving generics is resolved prior to the end of this stay). On the intellectual property (IP) side, MPLT has composition-of-matter patents that expire between 2031-32 and several other issued and pending patents that extend IP coverage into the 2040s.

### **ML-007C-MA has potential in other neurodegenerative/psychiatry diseases**

ML-007C-MA's mechanism of action has clear applications for other neurodegenerative/psychiatry indications such as bipolar mania, Alzheimer's agitation, Alzheimer's cognition, and autism irritability. This means ML-007C-MA has the potential to expand into these indications as well.

### **MPLT is not just a one-trick pony**

ML-007C-MA is the company's clear lead candidate. That said, MPLT has ML-004 in Phase 2 trials for ASD. The company also has preclinical candidates, ML-021 (M4 antagonist) for Parkinson's disease (PD) and ML-009 (GPR52 positive allosteric modulator/PAM) for hyperactivity/impulsivity. The company recently signed a strategic collaboration with SandboxAQ to utilize artificial intelligence (AI) to develop potential first-in-class therapies targeting a novel G protein-coupled receptor (GPCR) for the treatment of CNS disorders.

### **Management and board have significant biopharma experience**

We believe the company has assembled a very solid management team and board. For example, CEO/Co-founder Chris Kroeger was CEO at Cardioxyl and OvaScience and was a board member at Stellaromics and Antila Biosciences. Chief Medical Officer (CMO) Erin Pennock Foff was executive director of clinical development at Acadia where she led the programs in the dementia/neurodegenerative space. Chief Financial Officer Vishwas Setia has several years of experience in life science investment banking. Members of the board have significant experience in major biopharma, for example. In addition, MPLT's scientific founders, Dr. Karl Deisseroth and Dr. Robert Malenka (also on the board) are internationally renowned for their contributions to neuroscience/psychiatry.

### **Success in large neuropsychiatry indications typically adds scarcity value**

As we have noted several times in other contexts, development of products that target neuropsychiatry conditions is a high-risk/high-reward endeavor. As such, we believe any company that is successful in developing such assets and getting them approved can be seen as generating significant scarcity value for investors and strategic interests in the space.

## **Investment risks**

### **Exposure synergism rationale makes sense, but Phase 2 trial yet to read out**

Clinical trials involving product development for neuropsychiatry conditions are not without risk. While we view ML-007C-MA's mechanism as somewhat derisked, we also note the Phase 2 trial is yet to read out. In addition, the product will likely need to succeed in one or more Phase 3 trials as well to eventually support a new drug application (NDA) filing and receive approval.

### **Safety profile looks good so far, but is yet to be proven in larger trials**

MPLT has shown ML-007C-MA has been safe and well tolerated so far with some favorable signals relative to competition at its intended doses of 210/3mg BID and 330/6mg QD for schizophrenia, and 210/3mg BID for ADP in Phase 1 trials. But eventual safety has yet to be proven in a larger clinical program.

### **Generic challenges are inevitable especially on successful brands**

As with any small molecule biopharmaceutical, patent challenges from generic manufacturers will eventually pop up on approved brands, often at the very first opportunity that they are allowed to do so. In this case, if ML-007C-MA is approved, we

would expect at least 7.5 years of no generic competition from the date of approval, i.e., 5 years of new chemical entity exclusivity (NCE) and an automatic 30-month stay of approval on Paragraph IV generic challenges from the end of NCE (except in the unlikely event that a court case involving generics is resolved prior to the end of this stay).

#### **Even if ML-007C-MA is approved, can MPLT scale profitably?**

Even if ML-007C-MA is approved, a relatively small organization such as MPLT may find it difficult to commercialize the product by itself. At this time, we believe MPLT intends to commercialize the product in the US and could seek appropriate ex-US partnerships.

#### **Potential for dilutive capital-raising activity; cash runway through 2027**

Per its latest corporate deck (Jan-26), MPLT said it has a cash runway through 2027, which includes the important Phase 2 data readouts. As with any development-stage biopharma company, there is the potential for MPLT to raise capital, which could result in dilution. For example, we model a \$150mn raise in 3Q26 on the back of Phase 2 schizophrenia data. Means of non-dilutive financing exist in the form of potential partnerships, etc., especially in ex-US geographies where MPLT may be open to such agreements, although we note the current US Administration's Most Favored Nations pricing initiatives are still evolving and create a bit of a complicated picture.

## Model assumptions

### **Revenue**

Assuming MPLT is successful in its clinical trial programs and obtaining FDA approvals for ML-007C-MA, we model US launches in 2030E for schizophrenia and 2031E for ADP. We estimate peak unadjusted US sales of \$1.1bn for schizophrenia and \$2.6bn for ADP in 2036E, which is our model horizon. Below, we provide a more detailed overview of our modeling assumptions for ML-007C-MA. For our valuation, we assume probabilities of approval of 40% for schizophrenia and 30% for ADP. We currently do not include any specific positive contributions from ML-007C-MA for indications other than schizophrenia and ADP, or from other pipeline products. We also do not include any ex-US contributions in our model/valuation.

### **Our market/sales model for ML-007C-MA for schizophrenia**

We start with the assumption that schizophrenia affects ~3mn patients in the US, which is in line with the company's estimates. Of these patients, we assume ~40% are receiving prescription-based treatment annually (80% receiving prescriptions of which ~50% "stick" in a year). On market share, we assume initial ML-007C-MA penetration of 0.25% at launch in 2030E, which we ramp to 3.5% in 2036E. On annual net price of ML-007C-MA treatment, we assume \$16,000/year at launch. We believe this is reasonable as it is roughly at parity with our assumption of an annual net price for Copenfy. We assume price growth of 2.5% per year, which is roughly in line with inflation. While we are comfortable with this estimate currently, we will continue to keep a close watch on evolving variables based on efficacy, safety, payer responsiveness, etc.

These assumptions lead us to our unadjusted annual US sales estimates of ~\$57mn in 2030E (launch year) and \$1.1bn in 2036E (peak sales year; end of specific model horizon). Please see Table 2 for details on our revenue build for schizophrenia.

**Our market/sales model for ML-007C-MA for ADP**

We start with an Alzheimer's disease (AD) patient population in the US of ~7mn adults, which is in line with the company's estimates.

Of the US AD patients, we assume ~40% of patients experience psychosis. On market share, we assume initial ML-007C-MA penetration of 0.25% at launch in 2031E, which we ramp to 3.75% in 2036E. We assume the same net price for this indication vs. schizophrenia, which we view as reasonable unless there happen to be major differences in dosing.

These assumptions lead us to our unadjusted annual US sales estimates of ~\$133mn in 2031E (launch year) and \$2.6bn in 2036E (peak sales year; end of specific model horizon). Please see Table 3 for details on our revenue build for ADP.

**Table 2: ML-007C-MA for schizophrenia – market/sales model**

| (\$mn, except patient numbers) [FY - DEC]   | 2025E | 2026E | 2027E | 2028E | 2029E | 2030E       | 2031E        | 2032E        | 2033E        | 2034E        | 2035E        | 2036E          |

Source: Company reports, Canaccord Genuity estimates

### **Gross margin**

We assume the cost of goods sold (COGS) mainly consists of the active pharmaceutical ingredient (API), which, for a small molecule, is relatively low. As such, we assume a somewhat typical small-molecule branded gross margin, which we estimate is 94% over our model horizon in this case.

### **Operating expenses**

#### **R&D**

We model unadjusted R&D expenses of \$124mn in 2026E, ramping to \$150mn/\$155mn/\$160mn in 2027E/28E/29E to support Phase 3 trial-related expenses. For 2030E and beyond, we taper our R&D estimates. While this could be somewhat unrealistic in the real world, we do this mainly to not unfairly dock the company, as we currently do not include any pipeline contributions other than for schizophrenia and ADP.

#### **SG&A**

We model unadjusted SG&A expenses of \$50mn in 2026E ramping to \$200mn in 2030E (launch year). We then model significant growth in 2031/32E and more modest growth in each year thereafter. We note this could be subject to significant change as several variables (e.g., pricing, commercial strategy, etc.) are still evolving.

#### **Taxes**

We assume 2031E will be the first year that MPLT could report a profit. At steady state, we model a tax rate of 21% (2035E+), prior to which we assume net operating losses and other credits could keep the rates lower.

#### **Shares outstanding**

We assume fully diluted weighted-average shares outstanding of ~45.8mn in 1Q26E.

Please see our detailed income statement, presented below in the financial model section, for additional details.

#### **Balance sheet and cash flow**

We model 2032E as the first cash-flow positive year. MPLT has said it has ~\$450mn in cash and no debt at the end of its 4Q25 (per its Jan-26 slide deck), which it expects to provide a cash runway through 2027. We assume capital raises in 3Q26E and beyond the timing of which is based on our estimates for data releases and/or regulatory events.

#### **Discounted cash flow (DCF)**

We value MPLT using a discounted cash flow (DCF) methodology. For our DCF, we: 1) model sales for a defined period from 2026E to 2036E; 2) include a contribution from ML-007C-MA for schizophrenia and ADP at probabilities of approval of 40% and 30%, respectively; 3) give no specific credit for other pipeline programs (e.g., ML-004 for autism spectrum disorder/ASD, ML-021, ML-009, etc.); 5) probability-weight R&D and SG&A expenses in 2027E and beyond (as Phase 2 top-line data readouts are coming in 2026E). We then compute terminal value based on a 0% terminal growth rate. We discount after-tax profits back to the end of 2026E at a discount rate of 15%, which we believe is a reasonable assumption for a clinical-stage company's weighted average cost of capital (WACC). This leads to our 12-month DCF-based price target of \$35 for MPLT. See Table 4 below for our detailed DCF.

**Table 4: MPLT discounted cash flow analysis (DCF)**

## DCF-based valuation scenarios

### Varying probabilities of approval for ML-007C-MA in schizophrenia

Our base case assumes a 40% probability of approval for ML-007C-MA in schizophrenia, which results in a DCF value/share of \$35. If we were to raise our probability of approval to 67%/100% (better cases), our DCF values/share would be ~\$41/\$48, respectively, all else equal (see Table 5). Conversely, in a worse case, if we were to decrease our probability of approval to 15%, our DCF value/share would drop to ~\$29. For reference, we estimate MPLT has net cash/share of ~\$9 at the end of 2026E.

**Table 5: Sensitivity analysis based on the probability of approval of ML-007C-MA in schizophrenia**

| Probability of approval of ML-007C-MA for Schizophrenia | 15%  | 40% (Base) | 67%  | 100% |
|---------------------------------------------------------|------|------------|------|------|
| DCF value per share                                     | \$29 | \$35       | \$41 | \$48 |

### Varying probabilities of approval for ML-007C-MA in ADP

Our base case assumes a 30% probability of approval for ML-007C-MA in ADP, which results in a DCF value/share of \$35. If we were to raise our probability of approval to 67%/100% (better cases), our DCF values/share would be ~\$59/\$80, respectively, all else equal (see Table 6). Conversely, in a worse case, if we were to decrease our probability of approval to 15%, our DCF value/share would drop to ~\$25.

**Table 6: Sensitivity analysis based on the probability of approval of ML-007C-MA in schizophrenia**

| Probability of approval of ML-007C-MA for ADP | 15%  | 30% (Base) | 67%  | 100% |
|-----------------------------------------------|------|------------|------|------|
| DCF value per share                           | \$25 | \$35       | \$59 | \$80 |

Source: Company Reports, Canaccord Genuity estimates

### What if sales are 0.5x/1.5x vs. our base case?

Our base case assumes peak unadjusted sales of ML-007C-MA for schizophrenia and ADP of \$3.7bn in 2036E. If we were to assume sales were 0.5x/1.5x vs. our base case, our DCF values/share would be ~\$13/\$56 (see Table 7).

**Table 7: What if ML-007C-MA sales were 0.5x/1.5x vs. our base case of 2030E?**

| ML-007C-MA sales assumption | 0.5x | 1x (Base) | 1.5x |
|-----------------------------|------|-----------|------|
| DCF value per share         | \$13 | \$35      | \$56 |

# A quick look at MPLT's platform-enabled pipeline

## Multi-pronged drug discovery platform

MPLT's CNS drug discovery platform utilizes a differentiated approach based on the company's deep understanding of the causal links between modulation of defined neural circuits and the resulting changes in disease-specific behaviors. The platform consists of three major pieces: 1) optogenetics to probe the function of specific neural circuits using light; 2) transcriptomics to assess gene expression of cells of interest in the neural circuit; and 3) STARmap to visualize gene expression in neural circuits and verify expression, selectivity, and location of druggable targets. See Figure 1 for an overview of MPLT's discovery platform.

**Figure 1: MapLight's discovery platform**

Source: Company reports

## Lead candidate development using optogenetics

MPLT's lead programs are focused on two key brain circuits originating in the striatum called the "direct" and "indirect" pathways. The direct pathway facilitates reinforcement, motivation, and movement, while the indirect pathway suppresses movement. These pathways are implicated in Parkinson's disease (PD), schizophrenia, depression, and autism spectrum disorder (ASD). Using optogenetic activation of the indirect and direct pathways, MPLT found that muscarinic M1 receptor stimulation reduced hyperactivity in models of schizophrenia and muscarinic M4 receptors reduced hyperactivity in psychosis models. This finding led to the development of the M1/M4 agonist, ML-007, for psychosis. In addition, optogenetic activation of serotonin inputs to the nucleus accumbens located in the ventral striatum increased sociability in mice, which led to choosing the 5-HT1B agonist, ML-004 for sociability and irritability in ASD. MPLT similarly utilized this platform to come up with preclinical candidates ML-021 and ML-009 for Parkinson's disease and impulsivity/hyperactivity in CNS disorders, respectively. An overview of MPLT's pipeline candidates is shown below in Figure 2.

**Figure 2: MapLight's pipeline assets**

## A deeper look at ML-007C-MA

### What is ML-007C-MA?

ML-007C-MA is a fixed-dose combination of a centrally acting M1/M4 muscarinic agonist, ML-007, co-formulated with a peripherally acting anti-cholinergic (PAC), fesoterodine. The product is designed to drive efficacy through activation of both M1 and M4 receptors in the CNS and mitigate peripheral cholinergic side effects through pharmacokinetic synchronization of the agonist and antagonist exposure. MPLT is conducting two Phase 2 trials (ZEPHYR and VISTA) for ML-007C-MA for schizophrenia and Alzheimer's disease psychosis (ADP) and expects top-line data in 3Q26 and 2H27, respectively.

MPLT believes ML-007 works by selectively activating muscarinic M1 and M4 receptor subtypes that are highly expressed in the brain. Specifically, psychosis is typically thought to be mediated by M1/M4 agonism in the basal ganglia, prefrontal cortex and hippocampus. Activation of M1 and M4 receptors in the basal ganglia counterbalances dopamine activity, which leads to stronger reliance on external cues to shape reality and reduces delusions, hallucinations and other symptoms of psychosis. Activation of M1 receptors in the prefrontal cortex and hippocampus can enhance the formation of coherent and linear set of short- and long-term memories that underpin the perception of stable reality. On the other hand, M1/M4 receptors are also expressed in the peripheral tissues that are involved in mediating involuntary movements and glandular secretions, and their activation leads to unwanted gastrointestinal (GI) side effects (vomiting, diarrhea, salivation, etc.).

So, MPLT's approach of combining ML-007 with a peripherally acting anti-cholinergic aims to enable sufficient agonist activity in the brain to achieve efficacy while mitigating peripheral procholinergic side effects seen in prior M1 and/or M4 targeted approaches; see Figure 3.

Recall that in Sep-24, the FDA approved Bristol/Karuna's Cobenfy, which is also a combination of an M1/M4 agonist, xanomeline, with a peripheral muscarinic antagonist, trospium. This was the first time in decades that the FDA approved a drug with a novel mechanism of action for schizophrenia.

MPLT aims to take this scientific and formulation elegance displayed by Karuna/Bristol a step further with ML-007C-MA by exposure matching, etc., and believes it could have a class-leading product that could address the unmet need in schizophrenia and ADP patients.

**Figure 3: Limitations of prior development efforts within the muscarinic class**

| Structural and Biological Constraints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Historical Development Approaches and Challenges                                                     |                                                                                                                                                                                                                                              |

### Phase 1 and preclinical data suggest solid differentiation

MapLight's ML-007C-MA could potentially be a best-in-class M<sub>1</sub>/M<sub>4</sub> agonist and PAC combination and the product could have improved tolerability and convenient dosing relative to currently-approved competition, i.e., Cobefy. Targeting muscarinic receptors with their differentiated mechanism of action compared to current dopaminergic antipsychotics presents a novel approach for the treatment of schizophrenia and ADP. We note again that the FDA's approval of Cobefy established proof of efficacy and tolerability of an approach consisting of combining an M<sub>1</sub>/M<sub>4</sub> agonist with a PAC, which somewhat de-risks the path for MPLT and/or others that might attempt to utilize this approach.

The company believes ML-007C-MA could be more potent and safer with more convenient dosing vs. Cobefy as demonstrated by Phase 1 pharmacokinetic (pK) and preclinical pharmacodynamic (pD) data shown in Figures 4-7.

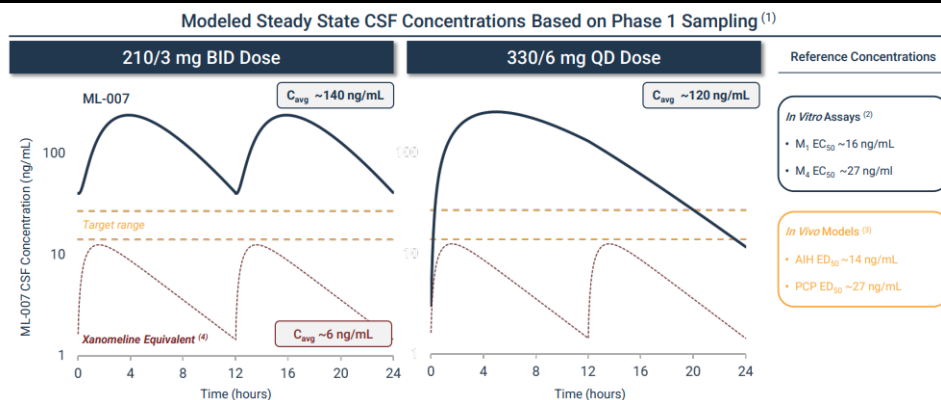

The ML-007 cerebrospinal fluid (CSF) steady-state concentration profile modeled from plasma pK exposures from the Phase 1 (O13) study is shown in Figure 4. ML-007 exceeded the CSF exposure target ranges of 14-27ng/mL at both 210mg BID and 330mg QD dosing regimens with average concentrations of approximately 140ng/mL and 120ng/mL, respectively. Modeling based on reported xanomeline human plasma concentrations did not reach the targeted range with an average concentration of approximately 6 ng/mL. In addition, preclinical head-to-head pharmacodynamic data showed that ML-007 has >8x greater activity vs. xanomeline across three mouse models as shown in Figure 5. Higher ML-007 CSF concentrations and M<sub>1</sub>/M<sub>4</sub> receptor agonism may lead to greater target engagement and efficacy, which will need to be further demonstrated in larger clinical trials.

MPLT believes precision matching peripheral exposures of ML-007 and PAC may limit the pro- and anti-cholinergic effects. See Figure 6 for steady-state plasma

concentrations of ML-007 and PAC at the 210/3mg BID dose and 330/6mg QD dose from the Phase 1 (013) study. The plasma exposures of both ML-007 and PAC are closely matched with approximately 30% coefficient of variation. For Cobenfy, xanomeline and trospium's times to maximum concentration could be mismatched by ~1hr (2hrs vs. 0.7hrs); see Figure 7. This variability of pK between xanomeline and trospium could result in excess agonism/antagonism that could create pro-cholinergic and anti-cholinergic adverse effects. Conversely, ML-007C-MA's profile has the potential to mitigate these pK mismatch effects, which may improve the product's safety and tolerability vs. Cobenfy.

ML-007C-MA also aims to improve upon the dosing regimen used for Cobenfy in schizophrenia and ADP. In this case, MPLT expects to utilize once- (QD) or twice-daily dosing (BID), minimal titration, and currently does not expect a fasting requirement. In the Phase 1 (013) study, healthy adults tolerated target doses better using a single lower titration dose, and a two- or seven-day titration period in healthy elderly participants. In addition, ML-007C-MA was well tolerated in fed and fasted conditions, i.e., no "food effect" We note Cobenfy requires twice-daily dosing, a three to eight day titration period for schizophrenia and five weeks for ADP, and dosing at least one hour before a meal or at least two hours after a meal (Cobenfy label and [clinicaltrials.gov](https://clinicaltrials.gov)). A more convenient dosing regimen utilized by ML-007C-MA may improve patient adherence and compliance if approved.

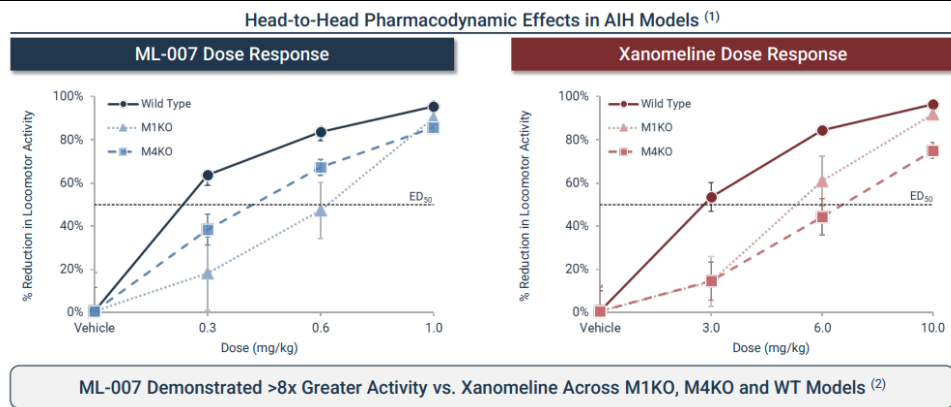

**Figure 4: ML-007C-MA's CSF exposure vs. xanomeline**

Dose notation refers to the co-formulated combination of ML-007 and PAC (fesoterodine). For example, 210/3 mg indicates 210 mg of ML-007 and 3 mg of fesoterodine.  $C_{avg}$  = average concentration;  $C_{max}$  = maximum concentration;  $EC_{50}$  = median effective concentration. (1) ML-007 lines represents modeled estimates for CSF exposures based on LP sampling conducted during Study 013. (2)  $EC_{50}$  estimates for  $M_1$  based on IP1 levels measured using an IPOne assay and  $M_4$  based on cAMP levels measured using a GloSensor assay. (3) CSF exposure-response was conducted across multiple preclinical animal models which defined a target efficacious range of 14–27 ng/mL (AIH and PCP models, respectively). (4) Represents the ML-007 equivalent CSF concentration estimate of xanomeline (Cobenfy) based on reported median  $C_{avg}$  and  $C_{max}$  human plasma concentrations at steady state of ~5 ng/mL and ~9 ng/mL, respectively, and 1% CSF:plasma ratio based on NHPs. These estimates rely on Company's extrapolations as xanomeline's CSF concentrations have not been directly reported

### ML-007C-MA's safety data in healthy adults and elderly

The company studied ML-007C-MA in four Phase 1 studies to optimize formulation, evaluate food effects, titration, dosing and safety as shown in Figure 8. The most recent Phase 1 (O13) study utilized a co-formulated extended-release tablet of ML-007 and PAC, and included four cohorts: 1) single 165/3mg ML-007C-MA dose under fasted and fed conditions (n=10); 2) escalating doses of ML-007C-MA up to 210/3mg BID and 330/6mg QD (n=8); 3) and 4): multi-dose paradigm with seven-day treatment at target maintenance dose for healthy adult and elderly volunteers (n=32/cohort). Cohort 1 revealed a higher pK exposure of ML-007 in fed vs. fasted conditions, with no food effect on PAC pK. ML-007C-MA was well tolerated in fasted conditions and improved in fed conditions. In Cohort 2, ascending doses up to 210/3mg BID and 330/6mg QD were generally safe and well tolerated. That said, tolerability improved for 210/3mg BID with a single, lower titration dose 12 hours prior.

Safety data from Cohort 3 helped inform the dosing for ML-007C-MA in the Phase 2 trial for schizophrenia. All four doses evaluated in Cohort 3 were well tolerated during titration and seven-day maintenance dosing, with most treatment-emergent adverse events (TEAEs) being mild. Notably, at the doses selected for the Phase 2 schizophrenia trial, i.e., 210/3mg BID and 330/6mg QD, there were no anti-

cholinergic TEAEs. Safety data from these doses compared to pooled data from the Cobenfy Phase 1 (KAR-003) trial show similar safety profiles, as shown in Table 8. Importantly, ML-007C-MA did not have any TEAEs of vomiting, while Cobenfy reported 28% vomiting for the 100/20mg BID cohort, its lowest-approved dose. We note that safety profiles between healthy adults and schizophrenia patients may differ, and larger datasets in the target patient population will be necessary to prove ML-007C-MA's differentiation.

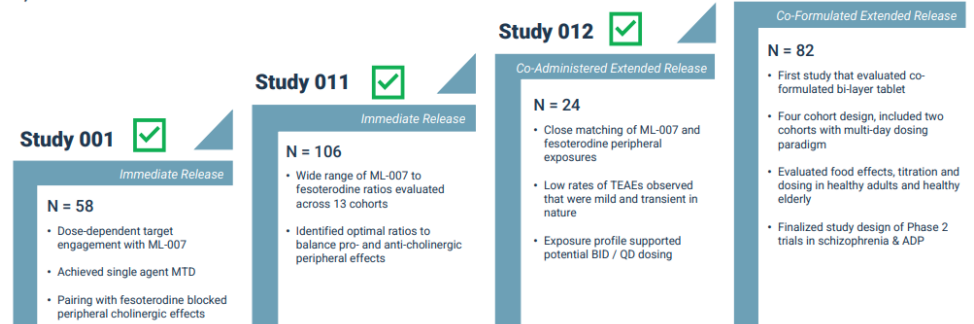

In Cohort 4 assessing dosing in healthy elderly volunteers, titration dose of 105/1.5mg BID and maintenance doses of 165/3mg BID and 210/3mg BID were well tolerated, while the maintenance dose of 330/6mg QD was not. The adverse events for the target dose for the ongoing Phase 2 trial in ADP, compared to pooled cohort data from a healthy elderly volunteer Phase 1b study of Cobenfy are shown in Table 9. Overall, the safety profile of ML-007C-MA was in line with Cobenfy. Importantly for the elderly population, there were low rates of vomiting and constipation and no episodes of urinary retention for ML-007C-MA. Higher rates of vomiting and constipation were seen from Cobenfy, with one notable serious adverse event due to urinary retention. In addition, 47% of elderly volunteers treated with Cobenfy had  $\geq 1$  moderate adverse event compared to 7% for the ML-007C-MA 210/3mg BID dose. We note that sample sizes in these trials are low and larger clinical trials are needed to establish a larger safety database.

### Ongoing Phase 2 trial in schizophrenia

MapLight has an ongoing Phase 2 trial (ZEPHYR) in schizophrenia and expects top-line data in 3Q26. This placebo-controlled, double-blind trial tests ML-007C-MA in adults with schizophrenia (n=300). The trial investigates two doses, 330/6mg QD and 210/3mg BID, versus placebo. Both doses include a single dose titration with a down-titration permitted once between weeks 1-3 to 270/6mg QD or 165/3mg BID, respectively. The primary endpoint is the change from baseline on the Positive and Negative Syndrome Scale (PANSS) at week five. The Phase 2 trial design is shown in Figure 9. Achieving statistical significance in the Phase 2 trial would bode well heading into a Phase 3.

**Figure 9: Phase 2 ZEPHYR trial design in schizophrenia**

### Ongoing Phase 2 trial in Alzheimer's disease psychosis

MapLight also has an ongoing Phase 2 trial (VISTA) in ADP and expects top-line data in 2H27. The placebo-controlled, double-blinded trial tests ML-007C-MA in elderly patients (55-90 yrs old) with ADP (n=300). The trial is investigating one dose, 210/3mg BID versus placebo. The trial utilizes a dose-titration period of 105/1.5mg BID during week-1 and 210/3mg BID during weeks two through seven with the option for a one-time dose reduction to 105/1.5mg BID for tolerability. The primary endpoint is the change from baseline on the Neuropsychiatric Inventory Clinician (NPI-C), Hallucinations and Delusions domain scores at week seven. See Figure 10 for the Phase 2 trial design. Achieving statistical significance in the Phase 2 trial would bode well heading into eventual Phase 3 readouts.

### ML-007C-MA could be a game changer in difficult-to-treat schizophrenia and ADP

Current treatments for schizophrenia and ADP aim to manage symptoms using antipsychotics. This class of drugs is associated with significant side effects such as risk of serious movement disorders, metabolic abnormalities, hyperprolactinemia, QT prolongation, and sedation. Antipsychotics also have a black-box warning for risk of increased mortality in elderly patients with dementia-related psychosis (DRP), which includes ADP. In schizophrenia, scientific literature suggests ~30% of patients have no response to a treatment, and approximately 74% of patients discontinue antipsychotic treatment within 18 months. In ADP, antipsychotics are used off-label, and currently, there are no approved treatments. ML-007C-MA is somewhat derisked given the similar mechanism of action to approved Cobenfy with the potential to be best-in-class that offers once-daily dosing, no fasting requirements, minimal titrations, and better efficacy and safety profile.

In the schizophrenia development landscape shown in Table 10 and Table 11, we see seven products in the Phase 3 development stage. Of the products targeting muscarinic receptors, Neurocrine's direclidine leads the way with Phase 3 data from two trials potentially in 2027/28E. In addition, AbbVie plans to start a Phase 2 trial for emraclidine, as an adjunct treatment after failing to demonstrate efficacy as a monotherapy in two Phase 2 trials. Separately, Neurocrine has NBI-570 in Phase 2 and expects data in 2028, while Neumora has NMRA-861/898 in Phase 1 development. We note there are several nuances between approaches (e.g., agonism, positive allosteric agonism/PAM, M1 vs. M4 vs. M1/M4) and these molecules do not combine with a peripheral muscarinic antagonist. That said, we will continue to keep a close watch on safety from larger clinical studies.

In the ADP development landscape shown in Table 12, we see Cobenfy as the farthest along. We estimate ML-007C-MA is behind by approximately three years, but could be best-in-class. Others in Phase 2 development include Acadia's remlifanserin and JNJ ITI-1284 (deuterated lumateperone). We note that efficacy and safety of these other compounds have yet to be proven clinically as well.

**Table 10: Select approved treatments and treatments in development for schizophrenia - overview**

| Company               | Drug name                               | Mechanism of action                                                                                                                | Phase   | Upcoming event               | Notes                                                                                                                                              |

## A quick overview of muscarinic receptor-targeting

Muscarinic acetylcholine receptors are potentially involved in important tasks such as the regulation of cognition, etc. There are five different muscarinic receptors (M1, M2, M3, M4 and M5) that are found in the body, including the brain.

Researchers hypothesize that activation of M1 and M4 receptors could help in improving cognition/negative symptoms and psychosis/positive symptoms in schizophrenia and Alzheimer's. For example, stimulation of M2 and M3 receptors does not appear to have similar effects. Hence, the drug development landscape primarily involves M1, M4, or M1/M4 selective targeting. M5 is low in expression (~2% of total muscarinic receptors) but is concentrated in the midbrain where dopaminergic neurons are active. Therefore, M5 development is relatively new, and an activation effect is unclear depending on location. For more details, see Table 13.

For details on some of biopharma's currently approved and in-development muscarinic M1 and/or M4 receptor-targeting products for CNS-focused indications, see Table 14. Please note that we have listed muscarinic receptor agonists, PAMs, and antagonists in our tables.

Muscarinic-receptor-targeting candidates are starting to gain more traction in the development landscape, with 13 products in clinical development, of which three (23%) are in Phase 3, three (23%) are in Phase 2, and seven (54%) are in Phase 1.

In Table 15, we list some products that may involve muscarinic-receptor targeting, but whose main mechanism may be via a different pathway (e.g., Anavex's Anavex2-73, which is a sigma-1-R agonist and M1 agonist).

Importantly, biopharma is currently evaluating muscarinic-receptor-targeting products in a broad range of CNS-indications such as schizophrenia, bipolar disorder, bipolar mania, Alzheimer's disease (AD) psychosis, AD agitation, AD cognition, autism irritability, obstructive sleep apnea (OSA), and movement disorders. Based on the underlying mechanisms for these products, ML-007C-MA could have the potential to target indications other than schizophrenia and ADP as well.

**Table 13: An overview of muscarinic receptor subtypes and targeted effects\***

| M receptor | Agonism/PAM Effects                                                                          | Hypothesized mechanism of action                                                                                                                                                                                        | Expression                                                  | GPCR                                                                 | Evidence support                                                                                             | Evidence against                                                                                |

## A quick look at ML-004 in autism

### What is ML-004?

ML-004 is an immediate-release/extended-release (IR/ER) formulation of the serotonin 5-HT<sub>1B/1D</sub> agonist, zolmitriptan, in development for the chronic treatment of social communication deficits and behaviors associated with autism spectrum disorder (ASD). Zolmitriptan has been commercially available since 1997 for acute treatment of migraine with more than 25mn prescriptions filled in the US. The product is designed to drive efficacy through activation of 5-HT<sub>1B</sub>, which has been implicated to increase sociability in animal models. MPLT is conducting a Phase 2 trial (IRIS) for ML-004 for social communication deficit and irritability in ASD and expects top-line data in 3Q26.

Current treatments for irritability in ASD include atypical antipsychotics, risperidone and aripiprazole. This class of drugs are associated with significant side effects such as increased appetite, weight gain, fatigue, extrapyramidal symptoms, metabolic changes, hyperprolactinemia, somnolence, and sedation. In ASD, approximately 25% of patients experience irritability and aggression. In addition, greater impairments in social communication are associated with higher rates of these behaviors. The only widely accepted intervention for the core symptoms of ASD is long-term behavioral therapy, which can place substantial burden on families, given the 30-40 hours/week of therapy required. ML-004 aims to provide an effective treatment to address ASD's core and associated symptoms, which represents a significant unmet need.

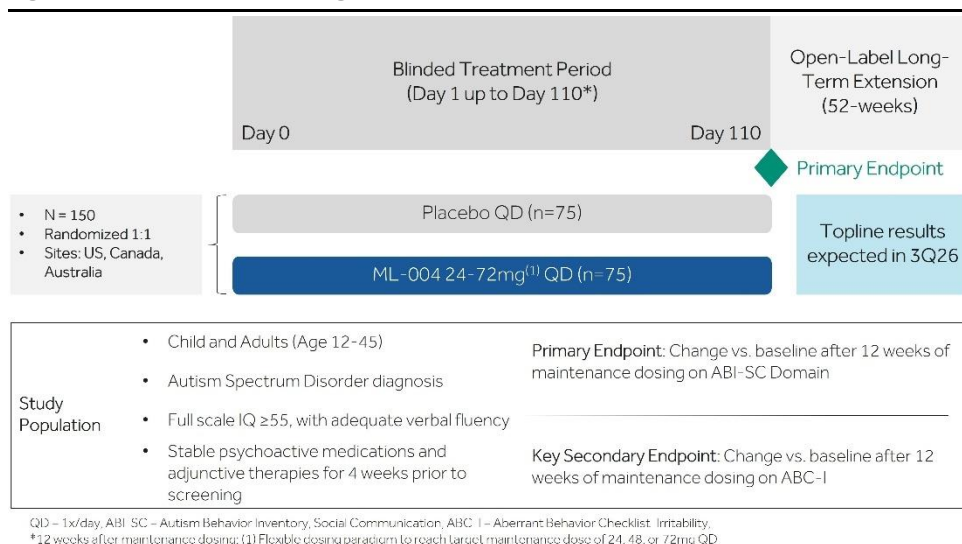

Zolmitriptan is currently used in low doses for acute treatment of migraine and as such, its IR safety profile is well established. For use as a chronic treatment, MapLight designed an IR/ER oral tablet formulation to allow for higher dosing. Preclinical studies demonstrated statistically significant improvements in sociability and aggression across four ASD mouse models. MapLight completed two Phase 1 trials in healthy volunteers to evaluate safety, tolerability, and PK of ML-004 for chronic use at higher doses than approved doses for zolmitriptan. ML-004 was well tolerated in the Phase 1 multiple ascending dose (MAD) trial in doses ranging from 5-40mg TID that included a two- to four-day titration up period, a seven-day treatment period, and two- to five-day down-titration period. Common adverse events were mostly mild and included headache, dizziness, nausea and hiccups. In the Phase 1 PK study a single dose of the 24mg oral tablet (6mg IR/18mg ER) prolonged the absorption phase and reduced max concentration compared to IR zolmitriptan. Modeling of these results led MapLight to believe that 48mg (12mg IR/36mg ER) and 72mg (36mg IR/54mg ER) would reach their target plasma exposure.

### Ongoing Phase 2 trial in autism spectrum disorder

MapLight has an ongoing Phase 2 trial (IRIS) in social/irritability in ASD and expects top-line data in 3Q26. The trial is placebo-controlled, double-blinded testing ML-004 in adolescent (age 12-17) and adult (age 18-45) patients with ASD (n=150). The trial includes a flexible dosing paradigm to reach target maintenance doses of 24mg, 48mg, and 72mg QD. The primary endpoint is change from baseline on the Autism Behavior Inventory, Social Communication (ABI-SC) Domain score after 12 weeks of maintenance dosing. The Phase 2 trial design is shown in Figure 11. Achieving statistical significance in the Phase 2 trial would bode well heading into a Phase 3.

**Figure 11: Phase 2 IRIS trial design in Autism Spectrum Disorder**

### Potential for novel therapy with ML-004 in autism spectrum disorder

With only two FDA-approved products for irritability associated with ASD, there is a great unmet need for therapies that target the core symptoms, which includes impaired social communication and restricted, repetitive thoughts and behaviors. In the current ASD development landscape shown in Table 16, we see Curemark's CM-AT leading the way with a completed Phase 3 trial and an ongoing rolling NDA submission, of which timing of completion is unclear. Separately, J&J has Caplyta (lumateperone), which is approved for schizophrenia, bipolar depression, and adjunct for major depressive disorder, in a Phase 3 program for ASD. We note that Caplyta targets the same mechanism of current approved products, Abilify and risperidone, for irritability in ASD. Other products with novel mechanisms in Phase 2 include Definium's DT-402, Yamo Pharma's L1-79, and Stalicia's STP1. Of these products, L1-79 is the only one Phase 3-ready. MapLight expects Phase 2 data for ML-004 in 3Q26, which may come before other competitors and put them second in development of the novel mechanism products if results are positive. That said, ML-004 has potential to become a much-needed new treatment option for ASD in a market with relatively few competitors.

**Table 16: Current product development landscape in autism spectrum disorder – overview\***

| Company  | Drug name    | Mechanism of action                                       | Phase   | Upcoming event                                    | Notes                                                            |
|----------|--------------|-----------------------------------------------------------|---------|---------------------------------------------------|------------------------------------------------------------------|
| MapLight | ML-004       | 5-HT1B/1D agonist                                         | Phase 2 | Data of Phase 2 in 3Q26                           | Immediate/extended release formulation of zolmitriptan           |
| Curemark | CM-AT        | High protease enzyme replacement therapy                  | Phase 3 | Potential update on NDA in submission 2026+       | 2.5-point improvement on ABC-I scores at 12 weeks in Phase 3     |

## What is schizophrenia?

### A quick overview of schizophrenia

Schizophrenia affects approximately 20mn people globally with more than 3mn people in the US (MPLT). Per the National Institute of Mental Health, approximately 1.6mn patients are being treated for schizophrenia in the US and approximately 70% discontinue treatment of dopaminergic antipsychotics within 18 months due to undesirable side effects or lack of efficacy. This translates to an economic burden of schizophrenia in terms of healthcare and indirect (unemployment, caregiving and other) costs exceeding \$154bn in the US. Schizophrenia usually occurs between ages 16 and 30 and is very rare in children and adults above 40.

### Symptoms

**Positive symptoms:** Psychotic behavior that is uncommon in healthy people, which includes hallucinations (person hearing voices, seeing things or smelling things that others cannot), delusions (holding onto false beliefs despite being presented with new ideas or facts), thought disorders (unusual thinking) and movement disorders (distressed body movements).

**Negative symptoms:** Unusual emotions and behaviors, which include reduced expression of facial emotions, voice tone, feelings of pleasure in life and speaking. In addition, individuals suffering from schizophrenia also face difficulty in beginning and continuing activities.

**Cognitive symptoms:** Difficulty in executing (e.g., understanding information and using it for making decisions), lack of focus and issues with using information immediately after learning it.

### Causes

Research suggests that schizophrenia can be caused by:

- Genetic variations (not just one but a mixture of several genetic and environmental factors can cause schizophrenia). Studies suggest there is a 10% probability that a person might suffer from schizophrenia if they had a first-degree relative with the disorder.
- Environmental exposure to viruses, malnutrition before birth, problems during birth, and other psychosocial factors can contribute as well.
- Variation in complex and interconnected chemical reactions of the brain involving the neurotransmitters dopamine and glutamate can play a role.

### Diagnosis

Schizophrenia is not easy to diagnose, as the use of LSD or methamphetamines can cause persons to display schizophrenia-like symptoms. There is no single test that can help diagnose schizophrenia. A physician needs to evaluate a person's symptoms over a period of six months or more and rule out other psychiatric diagnoses. A person must have two or more of the following symptoms to be diagnosed with schizophrenia: delusions, hallucinations, disorganized speech and/or negative symptoms.

### Treatments

To date, there is no cure for schizophrenia as the causes are still unknown. Treatments largely focus on management or elimination of symptoms of the disease and include antipsychotics (medications that influence brain chemicals that regulate emotions and thought patterns), psychotherapy (behavioral and supportive therapy) and supporting and caring for loved ones. Cobenfy (xanomeline and trospium) represents the first approval for a novel mechanism of action for schizophrenia in decades. Other recent atypical antipsychotic approvals include Bysanti (milsaperidone, prodrug of iloperidone) and Caplyta (lumateperone).

## What is Alzheimer's disease psychosis?

### A quick overview of Alzheimer's disease psychosis (ADP)

Alzheimer's disease psychosis (ADP) is a major clinical syndrome of Alzheimer's disease (AD), which is defined by the presence of delusions delusional misidentification and hallucinations. There are approximately 7mn people in the US and it is said that approximately 40% of these patients experience psychosis (Alzheimer's Association and MPLT). In addition, psychosis in AD is associated with more rapid cognitive decline, which often leads to early placement in nursing homes, excess morbidity, mortality, and hospital admissions. Approximately one-third of dementia care-related costs are driven by psychological symptoms due to the use of health services, direct care costs, and family time spent daily oversight, which creates a great economic burden.

### Symptoms

Delusions: examples include delusions of theft, persecution, infidelity, abandonment, or that deceased relatives are still living, belief that one's home is not one's home, belief that a family member is someone else, has been duplicated or is an imposter (Capgras delusion), belief that someone is living in the house (phantom boarder delusion), and misperceiving television, mirror or photos as real people/objects.

Hallucinations: experience involving the apparent perception of something not present. Primarily occur visually but can occur auditorily as well.

### Causes

The exact cause of ADP is currently unknown but research suggests that it can be linked to:

- Genetics: 61% estimated heritability, but no specific genes identified to date.
- Disruption in brain circuitry: D3 receptors, serotonin, muscarinic receptors, tau protein, kalirin.
- Patient factors: premorbid personality/psychiatric illness, acute medical problems, unmet needs (pain, sleep, etc.)
- Caregiver factors: stress/burden to caregiver, lack of education on dementia, communication issues
- Environmental factors: over/under stimulation, safety issues, lack of activity and established routines

### Diagnosis

The International Society to Advance Alzheimer's Research and Treatment (ISTAART) has developed ADP diagnostic criteria that consist of four categories:

1. Neurocognitive disorder or neurodegenerative disease
  - a. Diagnosed by established criteria
    - i. Clinical: progressive deterioration of behavior or cognition
    - ii. Neuroimaging findings (MRI, PET)
    - iii. Fluid biomarker positivity (amyloid, tau)
2. Stage of neurodegenerative disease
  - a. Preclinical, prodromal, or dementia (mild, moderate, severe)
3. Psychotic symptoms persisting at least intermittently for four weeks
  - a. Delusions: persecutory, misidentification, or other
  - b. Hallucinations: sensory modality (auditory, visual)
4. Exclusion criteria
  - a. Psychotic symptoms better accounted for non-neurodegenerative disease/medical condition/delirium
  - b. Psychotic symptoms better accounted for by a psychiatric disorder
  - c. Psychotic symptoms better accounted for by an affective or agitation neuropsychiatric syndrome
  - d. History of psychotic symptoms

### Treatments

Currently, there are no approved treatments for ADP and all drugs are used off-label. Therapies aim to manage symptoms using antipsychotics (typical and atypicals), antidepressants (tricyclics and SSRIs), mood stabilizers (valproic acid and carbamazepine), Cholinesterase inhibitors (metrifonate and donepezil) and benzodiazepines.

# What is autism spectrum disorder?

## A quick overview of autism spectrum disorder (ASD)

Autism spectrum disorder (ASD) is a neurological and developmental disorder characterized by repetitive patterns of behavior, interests, or activities, and problems in social interactions. ASD typically occurs before the age of three, with some cases within 12 months of birth. MapLight, citing the CDC, estimates there are approximately 1.8mn children and adolescents (ages 3-17) and over 5mn adults in the US with ASD. Of these patients, approximately 25% experience irritability and aggression. Higher health care and school costs, increased caregiver burden and loss of caregiver income and substantial functional, occupational and quality-of-life deficits create a great burden to patients and families.

## Symptoms

Social communication and interaction: don't respond to their name, poor eye contact, don't speak or have delayed speech, trouble having conversation or keep one going, speak with unusual tone or rhythm, repeat words or phrases, lack of understanding of simple questions or directions, lack of emotions or feelings, passiveness, aggression, and disruptive behavior when interacting with others.

Patterns of behavior: making same movement repeatedly, activities that could hurt themselves (biting or headbanging), lack of coordination or move in unusual patterns, unusual, stiff or exaggerated body language, fascination in details of objects, sensitivity to light, sound or touch, fixation on objects or activity, and preference for specific foods.

## Causes

The exact cause of ASD is unclear, but research suggests many factors may play a role:

- Genetic factors: monozygotic twins, siblings and families; genes involved in synapse formation and transcriptional regulation and chromatin remodeling.
- Environmental factors: parental age, maternal nutritional and metabolic status, infection during pregnancy, prenatal stress, exposure to certain toxins, heavy metals, or drugs.

## Diagnosis

Diagnostic criteria established by the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition, Text Revision (DSM-5-TR) include:

- Difficulties in social communication currently or by history, such as deficits in social-emotional reciprocity, nonverbal communicative behaviors used for social interaction, and developing, maintaining, and understanding relationships.
- Restricted, repetitive patterns of behavior, interests, or activities currently or by history of at least two of the following: stereotyped or repetitive motor movements, use of objects, or speech; insistence on sameness, inflexible adherence to routines, or ritualized patterns of verbal or nonverbal behavior; highly restricted, fixated interests that are abnormal in intensity or focus; or hyper- or hypo-reactivity to sensory input or unusual interest in sensory aspects of the environment.

- Symptoms must be present in early developmental period.
- Symptoms cause clinically significant impairment in social, occupational, or other important areas of current functioning.
- Disturbances are not better explained by intellectual development disorder or global development delay.

### Treatments

There is no cure for ASD and current treatments seek to reduce symptoms that interfere with daily functioning and quality of life. FDA approved therapies include aripiprazole and risperidone that treat irritability symptoms associated with ASD. Additional options include a range of cognitive behavioral therapy-based interventions to improve behavior and communication.

## MPLT – detailed catalyst calendar

**Table 17: MPLT catalyst calendar**

| Company-driven catalysts                                                                                    |                 |                               |                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------|-----------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event                                                                                                       | Expected Timing | Indication                    | Comments                                                                                                                                                                                                                |
| Top-line data of Phase 2 trial for ML-007C-MA in schizophrenia                                              | 3Q26            | Schizophrenia                 | M1/M4 agonist, with peripherally acting anticholinergic; trial initiated in (7/7/25)                                                                                                                                    |
| Top-line data of Phase 2 trial for ML-004 in autism spectrum disorder                                       | 3Q26            | Autism spectrum disorder      | Immediate/extended release formulation of zolmitriptan                                                                                                                                                                  |
| Completion of IND-enabling studies for ML-021 for Parkinson's disease                                       | 2H26            | Parkinson's disease           | -                                                                                                                                                                                                                       |
| Top-line data of Phase 2 trial of ML-007C-MA for ADP                                                        | 2H27            | Alzheimer's disease psychosis | M1/M4 agonist, with peripherally acting anticholinergic; trial initiated in (9/17/25)                                                                                                                                   |
| Update on preclinical studies for ML-009                                                                    | 2026+           | Hyperactivity/impulsivity     | Nominated preclinical candidate                                                                                                                                                                                         |
| Potential capital raising activity                                                                          | 2026+           | -                             | Cash runway through 2027 (Deck, 1/9/26)                                                                                                                                                                                 |
| Competitor-driven catalysts                                                                                 |                 |                               |                                                                                                                                                                                                                         |
| Event                                                                                                       | Expected Timing | Indication                    | Comments                                                                                                                                                                                                                |
| Initiation of Phase 3 trial for LB Pharma's LB-102 in schizophrenia                                         | 1Q26            | Schizophrenia                 | D2/D3/5-HT7 antagonist; hit primary PANSS endpoint in Phase 2 (1/8/25)                                                                                                                                                  |
| Data of Phase 2 trial for Alto's ALTO-101 in schizophrenia                                                  | End-1Q26        | Schizophrenia                 | PDE4 inhibitor; completed enrollment (2/13/26)                                                                                                                                                                          |
| Initiation of Phase 3 (RECOVER-2) trial for Reviva pharmaceuticals' brilaroxazine (RP5063) in schizophrenia | Early-2Q26      | Schizophrenia                 | Atypical antipsychotic; Phase 3 trial met primary endpoint on 50mg in PANSS at 4wks (10/30/23); -18.1 change in PANSS at 12-months in OLE (6/2/25); FDA requiring second Phase 3 trial before NDA submission (12/23/25) |
| Top-line of Phase 1 study of Neumora's NMRA-861 in schizophrenia                                            | Mid-26          | Schizophrenia                 | Next gen M4 PAM                                                                                                                                                                                                         |
| Potential update on Phase 1 study of Neumora's NMRA-898 in schizophrenia                                    | Mid-26          | Schizophrenia                 | Next gen M4 PAM; trial initiated 10/27/25                                                                                                                                                                               |

|                                                                                                                                                  |            |                                       |                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------------------|------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Top-line of Phase 2 (RADIANT) of Acadia's remlifanserin (ACP-204) for ADP                                                                        | Aug-Oct-26 | Alzheimer's disease psychosis         | Similar binding profile to pimavanserin, targets serotonergic system; minimizes QT signal, faster onset vs pimavanserin; Phase 1 showed favorable safety and tolerability (5/8/23); seamless enrollment to 2 P3 post Phase 2 DBL period completion; complete enrollment 1Q26 |
| Top-line data of Phase 3 pivotal trial (ENIGMA-TRS) for Newron Pharmaceuticals' evenamide as add-on therapy in treatment resistant schizophrenia | 4Q26       | Schizophrenia                         | Sodium channel blocker, attenuate glutamate release; positive analysis of 014/015 open label study; positive Phase 2/3 (008 study) as add-on (4/30/24)                                                                                                                       |
| Top-line data of Phase 2 trial for Kynexis' KYN-5356 in schizophrenia                                                                            | 4Q26       | Schizophrenia                         | Kynurenine Aminotransferase-II inhibitor; trial initiated (9/30/25)                                                                                                                                                                                                          |
| Top-line of Phase 3 (ADEPT-1, -2, -4) study of BMY's Cobenfy for psychosis in elderly patients with Alzheimer's disease                          | End-26     | Alzheimer's disease psychosis         | Phase 3 (ADEPT-2, -3) initiated (3Q23); enrolling additional patients in ADEPT-2 after irregularities identified at some study sites (12/3/25)                                                                                                                               |
| Data on Phase 2a trial of Definium's DT402 in autism spectrum disorder                                                                           | 2026       | Autism spectrum disorder              | R-MDMA; well tolerated at doses up to 255mg in SAD Phase 1 study                                                                                                                                                                                                             |
| Potential start Phase 2 of Abbvie's emraclidine as adjunct in Schizophrenia and in AD/PD/DLB psychosis                                           | 2026       | Schizophrenia and AD/PD/DLB psychosis | Positive Phase 1b on 6/29/21; does not induce BP increase based on Phase 1 BP trial (12/19/22); failed on both phase 2 trials (11/11/24); look to test higher dose in Phase 3                                                                                                |
| Estimated primary completion of Phase 2 of JNJ's ITI-1284 in ADP                                                                                 | Sep-27     | Alzheimer's disease psychosis         | Deuterated lumateperone                                                                                                                                                                                                                                                      |
| Data on Phase 1 study of Neurocrine's NBI-'569 in ADP                                                                                            | 2027       | Alzheimer's disease psychosis         | M4 preferring M1/M4 agonist                                                                                                                                                                                                                                                  |
| Top-line data on Phase 3 study of Neurocrine's direclidine (NBI-1117568) in schizophrenia                                                        | 2027/2028  | Schizophrenia                         | Licensed from Sosei Heptare; M4 receptor agonist; Phase 2 study, 20mg QD dose achieved stat sig but other 3 doses including 40mg QD, 80mg QD did not; Trial initiated 4/30/25                                                                                                |
| Potential top-line data on Phase 2 study of Neurocrine's NBI-'570 in schizophrenia                                                               | 2028       | Schizophrenia                         | M1/M4 agonist                                                                                                                                                                                                                                                                |

| Name                           | Designation                                 | Bio                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Christopher Kroeger, M.D.      | CEO, Co-Founder                             | Co-founded MapLight in 2018. >20 years of experience leading, building and advising development-stage therapeutic and medical device companies. Prev, CEO of Cardioxyl and OvaScience, and partner at Aurora Funds. Board member of Stellaromics and Antlia Biosciences. MD from Stanford University, MBA from Harvard Business School, BA in biology from Harvard University.                                                                                                                                                                                                                                                   |
| Vishwas Setia                  | CFO, Chief Financial Officer                | Joined March 2024. Decade of investment banking experience advising biopharmaceutical companies. Prev, Managing Director in the Healthcare group at Bank of America. MBA from Northwestern University and BE in mechanical engineering from Delhi College of Engineering, India.                                                                                                                                                                                                                                                                                                                                                 |
| Erin Pennock Foff, M.D., Ph.D. | CMO, Chief Medical Officer                  | Joined April 2021. >13 years of experience conducting and designing clinical trials. Prev, executive director of clinical development at Acadia Pharmaceuticals and cognitive neurologist at the University of Virginia. Holds a certification from the American Board of Psychiatry and Neurology. PhD in molecular and human genetics from Baylor College of Medicine, MD at Jefferson Medical College.                                                                                                                                                                                                                        |
| James Lillie, Ph.D.            | CSO, Chief Scientific Officer               | Joined May 2018. >25 years of experience in preclinical development operations. Prev, CSO at OvaScience, Senior Director/Vice President of In Vitro Biology at Sanofi Genzyme, Senior Director of Biology at Scriptgen Pharmaceuticals, co-founder of AMIRA, and roles at Millennium Pharmaceuticals. Supported approval of Cerdelga (eligulstat) for Gaucher's disease. PhD in biochemistry and molecular biology from Harvard University and BA in German literature from Wesleyan University.                                                                                                                                 |
| Anatol Kreitzer, Ph.D          | Chief Discovery Officer                     | Joined June 2020. >20 years of experience in academic neuroscience research. Prev, Professor of Physiology and Neurology at the University of California, San Francisco, where he led a lab focused on the basal ganglia. PhD in neurobiology from Harvard University, postdoctoral work at Stanford University, and BA in linguistics from the University of California, Berkeley.                                                                                                                                                                                                                                              |
| Jonathan Gillis                | Chief Administrative and Accounting Officer | Joined February 2019. >15 years of experience in public accounting and industry experience. Prev, CFO of MapLight from February 2019 to March 2024, Senior Vice President of Finance at OvaScience, Senior Manager of External Reporting and Compliance at GFI Software, and Manager at PricewaterhouseCoopers LLP. BS and MS in accounting from Babson College.                                                                                                                                                                                                                                                                 |
| Kristopher Hanson              | General Counsel                             | Joined April 2023. >25 years of legal experience advising public and private companies in capital markets and strategic transactions, commercial contracting and licensing, IP portfolio management, corporate governance, compliance, and litigation. Prev, Senior Vice President and General Counsel at PhaseBio Pharmaceuticals, Vice President for legal and compliance and head of human resources at Nalpropion Pharmaceuticals, Vice President and Assistant General Counsel for Orexigen Therapeutics, and roles at Lytx, Cricket Communications and SAIC. JD from UCLA School of Law and BA from Georgetown University. |

# Appendix: Important Disclosures

## Analyst Certification

Each authoring analyst of Canaccord Genuity whose name appears on the front page of this research hereby certifies that (i) the recommendations and opinions expressed in this research accurately reflect the authoring analyst's personal, independent and objective views about any and all of the designated investments or relevant issuers discussed herein that are within such authoring analyst's coverage universe and (ii) no part of the authoring analyst's compensation was, is, or will be, directly or indirectly, related to the specific recommendations or views expressed by the authoring analyst in the research, and (iii) to the best of the authoring analyst's knowledge, she/he is not in receipt of material non-public information about the issuer.

Analysts employed outside the US are not registered as research analysts with FINRA. These analysts may not be associated persons of Canaccord Genuity LLC and therefore may not be subject to the FINRA Rule 2241 and NYSE Rule 472 restrictions on communications with a subject company, public appearances and trading securities held by a research analyst account.

## Sector Coverage

Individuals identified as "Sector Coverage" cover a subject company's industry in the identified jurisdiction, but are not authoring analysts of the report.

## Investment Recommendation

Date and time of first dissemination: March 19, 2026, 05:07 ET

Date and time of production: March 19, 2026, 05:07 ET

## Target Price / Valuation Methodology:

MapLight Therapeutics - MPLT

We value MPLT using a discounted cash flow (DCF) methodology. For our DCF, we: 1) model sales for a defined period from 2026E to 2036E; 2) include contributions from ML-007C-MA for schizophrenia and Alzheimer's disease psychosis (ADP) at probabilities of approval of 40% and 30%, respectively; 3) give no specific credit for other pipeline programs, e.g., ML-004 in Phase 2 for autism spectrum disorder/ASD, and preclinical candidates ML-021 (Parkinson's disease/PD) and ML-009 (hyperactivity/impulsivity); 4) probability-weight R&D and SG&A expenses in 2027E and beyond (as Phase 2 top-line data readouts are coming in 2026E+). We then compute terminal value based on a 0% terminal growth rate. We discount after-tax profits back to the end of 2026E at a discount rate of 15%, which we believe is a reasonable assumption for a clinical-stage biopharma company's weighted average cost of capital (WACC). This leads to our 12-month DCF-based price target of \$35 for MPLT.

## Risks to achieving Target Price / Valuation:

MapLight Therapeutics - MPLT

Risks to our thesis: pipeline is focused on difficult-to-treat neuropsychiatry conditions such as schizophrenia and Alzheimer's disease psychosis (ADP), and neurodegenerative conditions; trial failures due to lack of efficacy/safety; lack of FDA acceptance of filings or approval; dilutive capital raising activity; and/or eventually unsuccessful launches or commercial performance due to greater than expected competition, pricing pressure or lack of sufficient resources to compete.

## Distribution of Ratings:

### Global Stock Ratings (as of 03/19/26)

| Rating          | Coverage Universe |        | IB Clients |
|-----------------|-------------------|--------|------------|
|                 | #                 | %      |            |
| Buy             | 666               | 69.23% | 27.48%     |
| Hold            | 136               | 14.14% | 8.09%      |
| Sell            | 3                 | 0.31%  | 0.00%      |
| Speculative Buy | 151               | 15.70% | 62.25%     |
|                 | 962*              | 100.0% |            |

\*Total includes stocks that are Under Review

## Canaccord Genuity Ratings System

**BUY:** The stock is expected to generate returns greater than 10% during the next 12 months.

**HOLD:** The stock is expected to generate returns from -10% to 10% during the next 12 months.

**SELL:** The stock is expected to generate returns less than -10% during the next 12 months.

**NOT RATED:** Canaccord Genuity does not provide research coverage of the relevant issuer.

Given the inherent volatility of some stocks under coverage, price targets for some stocks may imply target returns that vary temporarily from the ratings criteria above.

\*As of January 1, 2024, the Ratings History Chart will reflect the new Canaccord Genuity Ratings System as defined above.

### Risk Qualifier

**SPECULATIVE:** The stock bears significantly above-average risk and volatility. Investments in the stock may result in material loss.

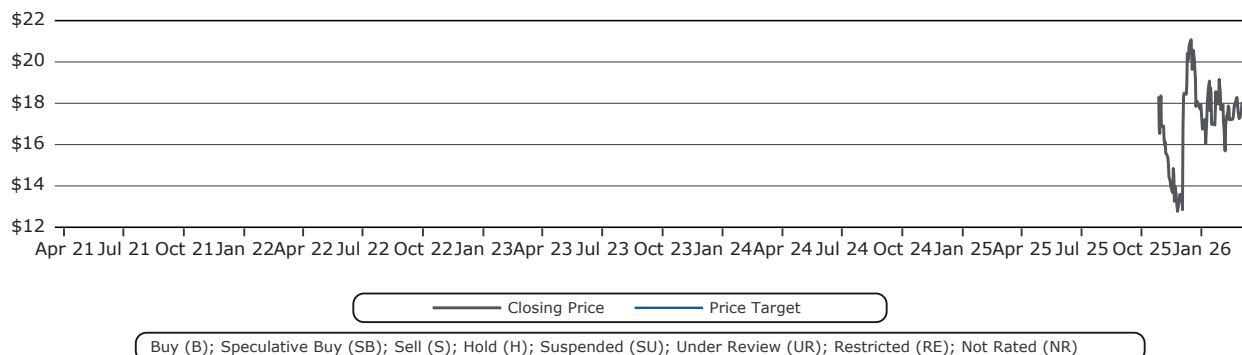

### 12-Month Recommendation History (as of date same as the Global Stock Ratings table)

A list of all the recommendations on any issuer under coverage that was disseminated during the preceding 12-month period may be obtained at the following website (provided as a hyperlink if this report is being read electronically) <http://disclosures-mar.canaccordgenuity.com/EN/Pages/default.aspx>

### Required Company-Specific Disclosures (as of date of this publication)

Canaccord Genuity or one or more of its affiliated companies intend to seek or expect to receive compensation for Investment Banking services from MapLight Therapeutics in the next three months.

**MapLight Therapeutics Rating History as of 03/18/2026**

### Past performance

In line with Article 44(4)(b), MiFID II Delegated Regulation, we disclose price performance for the preceding five years or the whole period for which the financial instrument has been offered or investment service provided where less than five years. Please note price history refers to actual past performance, and that past performance is not a reliable indicator of future price and/or performance.

### Online Disclosures

Up-to-date disclosures may be obtained at the following website (provided as a hyperlink if this report is being read electronically) <http://disclosures.canaccordgenuity.com/EN/Pages/default.aspx>; or by sending a request to Canaccord Genuity Corp. Research, Attn: Disclosures, P.O. Box 10337 Pacific Centre, 2200-609 Granville Street, Vancouver, BC, Canada V7Y 1H2; or by sending a request by email to [disclosures@cgf.com](mailto:disclosures@cgf.com). The reader may also obtain a copy of Canaccord Genuity's policies and procedures regarding the dissemination of research by following the steps outlined above.

### General Disclaimers

See "Required Company-Specific Disclosures" above for any of the following disclosures required as to companies referred to in this report: manager or co-manager roles; 1% or other ownership; compensation for certain services; types of client relationships; research analyst conflicts; managed/co-managed public offerings in prior periods; directorships; market making in equity securities and related derivatives. For reports identified above as compendium reports, the foregoing required company-specific disclosures can be found in a hyperlink located in the section labeled, "Compendium Reports." "Canaccord Genuity" is the business name used by certain wholly owned subsidiaries of Canaccord Genuity Group Inc., including Canaccord Genuity LLC, Canaccord Genuity Limited, Canaccord Genuity Corp., and Canaccord Genuity (Australia) Limited, an affiliated company that is 80%-owned by Canaccord Genuity Group Inc.

The authoring analysts who are responsible for the preparation of this research are employed by Canaccord Genuity Corp. a Canadian broker-dealer with principal offices located in Vancouver, Calgary, Toronto, Montreal, or Canaccord Genuity LLC, a US broker-dealer with principal offices located in New York, Boston, San Francisco and Houston, or Canaccord Genuity Limited, a UK broker-dealer with principal offices located in London (UK) and Dublin (Ireland), or Canaccord Genuity (Australia) Limited, an Australian broker-dealer with principal offices located in Sydney and Melbourne.

The authoring analysts who are responsible for the preparation of this research have received (or will receive) compensation based upon (among other factors) the Investment Banking revenues and general profits of Canaccord Genuity. However, such authoring analysts have not received, and will not receive, compensation that is directly based upon or linked to one or more specific Investment Banking activities, or to recommendations contained in the research.

Some regulators require that a firm must establish, implement and make available a policy for managing conflicts of interest arising as a result of publication or distribution of research. This research has been prepared in accordance with Canaccord Genuity's policy

on managing conflicts of interest, and information barriers or firewalls have been used where appropriate. Canaccord Genuity's policy is available upon request.

The information contained in this research has been compiled by Canaccord Genuity from sources believed to be reliable, but (with the exception of the information about Canaccord Genuity) no representation or warranty, express or implied, is made by Canaccord Genuity, its affiliated companies or any other person as to its fairness, accuracy, completeness or correctness. Canaccord Genuity has not independently verified the facts, assumptions, and estimates contained herein. All estimates, opinions and other information contained in this research constitute Canaccord Genuity's judgement as of the date of this research, are subject to change without notice and are provided in good faith but without legal responsibility or liability.

From time to time, Canaccord Genuity salespeople, traders, and other professionals provide oral or written market commentary or trading strategies to our clients and our principal trading desk that reflect opinions that are contrary to the opinions expressed in this research. Canaccord Genuity's affiliates, principal trading desk, and investing businesses also from time to time make investment decisions that are inconsistent with the recommendations or views expressed in this research.

This research is provided for information purposes only and does not constitute an offer or solicitation to buy or sell any designated investments discussed herein in any jurisdiction where such offer or solicitation would be prohibited. As a result, the designated investments discussed in this research may not be eligible for sale in some jurisdictions. This research is not, and under no circumstances should be construed as, a solicitation to act as a securities broker or dealer in any jurisdiction by any person or company that is not legally permitted to carry on the business of a securities broker or dealer in that jurisdiction. This material is prepared for general circulation to clients and does not have regard to the investment objectives, financial situation or particular needs of any particular person. Investors should obtain advice based on their own individual circumstances before making an investment decision. To the fullest extent permitted by law, none of Canaccord Genuity, its affiliated companies or any other person accepts any liability whatsoever for any direct or consequential loss arising from or relating to any use of the information contained in this research.

### Research Distribution Policy

Canaccord Genuity research is posted on the Canaccord Genuity Research Portal and will be available simultaneously for access by all of Canaccord Genuity's customers who are entitled to receive the firm's research. In addition research may be distributed by the firm's sales and trading personnel via email, instant message or other electronic means. Customers entitled to receive research may also receive it via third party vendors. Until such time as research is made available to Canaccord Genuity's customers as described above, Authoring Analysts will not discuss the contents of their research with Sales and Trading or Investment Banking employees without prior compliance consent.

For further information about the proprietary model(s) associated with the covered issuer(s) in this research report, clients should contact their local sales representative.

### Short-Term Trade Ideas

Research Analysts may, from time to time, discuss "short-term trade ideas" in research reports. A short-term trade idea offers a near-term view on how a security may trade, based on market and trading events or catalysts, and the resulting trading opportunity that may be available. Any such trading strategies are distinct from and do not affect the analysts' fundamental equity rating for such stocks. A short-term trade idea may differ from the price targets and recommendations in our published research reports that reflect the research analyst's views of the longer-term (i.e. one-year or greater) prospects of the subject company, as a result of the differing time horizons, methodologies and/or other factors. It is possible, for example, that a subject company's common equity that is considered a long-term 'Hold' or 'Sell' might present a short-term buying opportunity as a result of temporary selling pressure in the market or for other reasons described in the research report; conversely, a subject company's stock rated a long-term 'Buy' or 'Speculative Buy' could be considered susceptible to a downward price correction, or other factors may exist that lead the research analyst to suggest a sale over the short-term. Short-term trade ideas are not ratings, nor are they part of any ratings system, and the firm does not intend, and does not undertake any obligation, to maintain or update short-term trade ideas. Short-term trade ideas are not suitable for all investors and are not tailored to individual investor circumstances and objectives, and investors should make their own independent decisions regarding any securities or strategies discussed herein. Please contact your salesperson for more information regarding Canaccord Genuity's research.

### For Canadian Residents:

This research has been approved by Canaccord Genuity Corp., which accepts sole responsibility for this research and its dissemination in Canada. Canaccord Genuity Corp. is registered and regulated by the Canadian Investment Regulatory Organization (CIRO) and is a Member of the Canadian Investor Protection Fund. Canadian clients wishing to effect transactions in any designated investment discussed should do so through a qualified salesperson of Canaccord Genuity Corp. in their particular province or territory.

### For United States Persons:

Canaccord Genuity LLC, a US registered broker-dealer, accepts responsibility for this research and its dissemination in the United States. This research is intended for distribution in the United States only to certain US institutional investors. US clients wishing to effect transactions in any designated investment discussed should do so through a qualified salesperson of Canaccord Genuity LLC. Analysts employed outside the US, as specifically indicated elsewhere in this report, are not registered as research analysts with FINRA. These analysts may not be associated persons of Canaccord Genuity LLC and therefore may not be subject to the FINRA Rule 2241 and NYSE Rule 472 restrictions on communications with a subject company, public appearances and trading securities held by a research analyst account.

### For United Kingdom and European Residents:

This research is distributed in the United Kingdom and elsewhere Europe, as third party research by Canaccord Genuity Limited, which is authorized and regulated by the Financial Conduct Authority. This research is for distribution only to persons who are Eligible Counterparties or Professional Clients only and is exempt from the general restrictions in section 21 of the Financial Services and Markets Act 2000 on the communication of invitations or inducements to engage in investment activity on the grounds that it is being distributed in the United Kingdom only to persons of a kind described in Article 19(5) (Investment Professionals) and 49(2) (High Net Worth companies, unincorporated associations etc) of the Financial Services and Markets Act 2000 (Financial Promotion) Order 2005 (as amended). It is not intended to be distributed or passed on, directly or indirectly, to any other class of persons. This material is not for distribution in the United Kingdom or elsewhere in Europe to retail clients, as defined under the rules of the Financial Conduct Authority.

**For Jersey, Guernsey and Isle of Man Residents:**

This research is sent to you by Canaccord Genuity Wealth (International) Limited (CGWI) for information purposes and is not to be construed as a solicitation or an offer to purchase or sell investments or related financial instruments. This research has been produced by an affiliate of CGWI for circulation to its institutional clients and also CGWI. Its contents have been approved by CGWI and we are providing it to you on the basis that we believe it to be of interest to you. This statement should be read in conjunction with your client agreement, CGWI's current terms of business and the other disclosures and disclaimers contained within this research. If you are in any doubt, you should consult your financial adviser.

CGWI is licensed and regulated by the Guernsey Financial Services Commission, the Jersey Financial Services Commission and the Isle of Man Financial Supervision Commission. CGWI is registered in Guernsey and is a wholly owned subsidiary of Canaccord Genuity Group Inc.
